                             Penfold S.S., Simon J., Frost L.S.;

Regulation of the expression of the tram gene of the F sex factor of Escherichia coli.";

Mol. Microbiol. 20:549-58(1996).

-- FUNCTION: TRAI HAS BEEN IDENTIFIED AS DNA HELICASE I AND IT ALSO HAS AN ADDITIFIONAL ACTIVITY OF SITE-SPECIFIC NICKING AT ORIT. DNA HELICASE I IS A POTENT DNA-DEPENDENT ATPASE.

-- ALTERNATIVE PRODUCTS: THE TRAI* PROTEIN ARISES FROM AN INTERNAL IN-FRAME TRANSLATIONAL START IN TRAI.

-- SIMILARITY: STRONG TO TRAI OF PLASMID INCFII R100.

This is an example of a highly generic formula for a phosphopeptide of length 5-13 amino acids. The peptides can be made synthetically (e.g. chemical synthesis or generic engineering) or they can be extracted from cereals, nuts or vegetables or by fractionating a digest of casein, alpha-s-casein, beta-casein or a salt of it. Compositions comprising the peptide may take the form of foodstuff to or confectionery, dentifrices; mouthwashes and preparations for significantly increase absorption of gingival tissue. The peptides the gut. See AAR14447-R14451.

These peptides are pref. in the form of salts selected from alkaline metal, alkaline earth metal salts such as Na, Ca, Zn, Cu, Al, K, Sr, Mg and Ni salts. These peptides are pref. present as a Zn/phosphopeptide complex or aggregate. these peptides have anti-calculus potential, and are anti-caries and anti-
chloride to cause aggregation of the peptides in soln. and separating the aggregated phosphopeptides. This method allows prodn of the phosphopeptide by industrial methods. The phosphopeptide has anticariogenic activity and may be used as a dietectic. The peptide may be used in a microbiological growth medium, as a dietary supplement or as a fertiliser.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The peptide sequence is that of a phosphopeptide prepd. from a tryptic digest of casein. The peptide may be used with an anticalculus agent, e.g. alkali metal pyrophosphate, in a compsn. for controlling dental tartar. The compsn. inhibits conversion of brushite and amorphous calcium phosphate into the more stable hydroxyapatite on the teeth. The compsn. is used in the form of a mouthwash, toothpaste, gel, lozenge or chewing gum, for care of the teeth and tartar control.

                                                                                                                                                                                                                                                                                                                                                         Ser(P) = post-translationally phosphorylated serine. A mixture of casein phosphopeptides (CPP) and/or their salts may be used in a method for treating dentinal hypersensitivity. Pref. those CPPs contg. the sequence -Ser(P)-Ser(P)-Ser(P) - predominate. The CPPs can be extracted from a casein digest.
                                                                                                                                                                                                                                                                                                                   Treatment of dentinal hypersensitivity - using casein, component of casein, phospho-protein or phospho-peptide or their salts

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Peptides (AAR68936-40) are phosphopeptides resulting from the tryptic digestion of sodium caseinate. The peptide shown here is derived from the TCPK-tryptic digest of alpha(s2)-caseinate (comprising alpha(s2), alpha(s3), alpha(s4) and alpha(s6)). The peptides contain the amino phosphohistidine, and include in their sequence aspartate and glutamate. The phosphopeptides form part of a novel composition containing the peptide dispersed uniformly in a crystal mix of sugars chosen from sorbitol, mannitol, xylitol, lacticol, cellobiitol or mixtures of instead of conventional sugars to manufacture confectionary products. The phosphopeptides are known to inhibit caries and gludyitis and can act as a source of calcium ions to promote/enhance remineralisation.

```
The compositions are useful in humans and in veterinary medicine in domestic animals such as cattle, sheep, horses and companion animals e.g. cats and dogs as well as zoo animals. The present sequence represents a phosphopeptide component of a specifically claimed complex.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a stable calcium phosphate complex including phosphopeptide stabilised amorphous calcium phosphate (ACP) or its derivative, where the phosphopeptide includes the amino acid sequence: Ser(P)-Ser(P)-Glu-Glu. The amorphous phases stabilised by the phosphopeptides are a delivery vehicle for co-localisation of Ca, Producing superior anticaries efficacy over prior art. The amorphous phases stabilised by the phosphopeptides are also useful as dietary supplements to increase calcium bioavallability and to help prevent supplements to increase calcium bioavallability and to help prevent diseases associated with calcium deficiencies. They are particularly useful for treatment or prevention of dental caries, calcium malabsorption and bone diseases such as osteoporosis and osteomalacia.
                                casein; calcium phosphate complex; amorphous calcium phosphate; ACP; phosphopeptide; delivery vehicle; calcium fluoride; calcium deficiency; osteoporosis; osteomalacia; tooth; bone disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    oŧ

omprising a suspension or solution of a phosphopeptide (II) in water and thickening agent to form a thixotropic gel. (I) can have attinifiammatory and osteopathic activities. (I) can have attinifiammatory and osteopathic activities. (I) is useful for treating and preventing dental caries and dental sensitivity, gingivitis, mouth odour, osteoporosis, calculus formation in oral cavity in humans and animals. (I) is also useful for recrystallising and remineralising the enamel and/or dentine and also for buffering plaque against decrease in pH in humans and animals. Unlike prior art formulations, (I) has an pH in humans and is capable of producing a reliable gel without a loss of activity of (II) and other bloactive constituents. AAB12800 to

The invention relates to a composition comprising a peptide or its derivative. The peptide contains an amino acid sequence from alpha-S2 casein precursor. The peptides stimulate the growth of fibroblasts, and thus the synthesis and secretion of collagen. The peptides also stimulate of skin surface. The peptide is useful in the formation and regeneration in the form of a toothpasts or a chewing gum, for alleviating or preventing periodontal disease and a medicament preventing periodontal disease and a medicament in the form of a cosmetic composition for alleviating or preventing an effect of aging, particularly wrinkling of the skin. The present sequence is bovine alpha-S2 casein precursor protein.
                                                                     alpha-S2 casein precursor in the manufacture of a medicament for alleviating or preventing periodontal disease and an effect of aging in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a composition comprising a peptide or its derivative. The peptide contains an amino acid sequence from alpha-S2
                                                                                                                                                                                                    anionic polymers were chosen from a group consisting of carboxylate polymers, sulfonate polymers, polymers having both a carboxylate and a sulfonate moiety, and other such mixtures. The anionic polymeric stabiliser inhibits destabilisation of the phosphopeptide in the oral environment. These oral compositions, pref. containing a fluoride source may be used for inhibiting caries and gingivitis.
                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                 The sequences given in AAR31237-42 represent phosphopeptides which were used as the active agents in an oral composition. These peptides were stabilised by an anionic polymeric stabiliser. The

The invention relates to a composition comprising a peptide or its derivative. The peptide contains an amino acid sequence from alpha-S2 casein precursor. The peptides stimulate the growth of fibroblasts, and the structure of the growth of fibroblasts, and secretion of collagen. The peptides also stimulate the growth of keratinocytes, which aid in the formation and regeneration of skin surface. The peptide is useful in the manufacture of a medicament in the form of a toothpasts or a chewing gum, for alleviating or preventing periodontal disease and a medicament in the form of a cosmetic composition for alleviating or preventing an effect of aging, particularly wrinking of the skin. The present sequence is goat
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Goat; alpha-S2 casein; dermatological; antiinflammatory; fibroblast; collagen; keratinocyte; skin regeneration; medicament; toothpaste; aging; chewing gum; cosmetic; wrinkling; periodontal disease.
                      thus the synthesis and secretion of collagen. The peptides also stimulate thus the synthesis and secretion of collagen. The peptides also stimulate growth of keratinocytes, which aid in the formation and regeneration of skin surface. The peptide is useful in the manufacture of a medicament in the form of a toothpaste or a chewing gum, for alleviating or a commenting periodontal disease and a medicament in the form of a cosmetic composition for alleviating or preventing an effect of aging, composition for alleviating of the skin. The present sequence is alpha-52 casein precursor (alpha-52-CN) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Use of peptide or its derivative containing an amino acid sequence in alpha-S2 casein precursor in the manufacture of a medicament for alleviating or preventing periodontal disease and an effect of aging in
casein precursor. The peptides stimulate the growth of fibroblasts, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a composition comprising a peptide or its derivative. The peptide contains an amino acid sequence from alpha-S2 casein precursor. The peptides stimulate the growth of fibroblasts, and thus the synthesis and secretion of collagen. The peptides also stimulate of skin surface. The peptide is useful in the formation and regeneration in the form of a Lochtpaste or a chewing qum, for alleviating or preventing periodontal disease and a medicament in the form of a cosmetic composition for alleviating or preventing an effect of aging, particularly wrinkling of the skin. The present sequence is alpha-S2 casein precursor (alpha-S2-CN) protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Use of peptide or its derivative containing an amino acid sequence in alpha-S2 casein precursor in the manufacture of a medicament for alleviating or preventing periodontal disease and an effect of aging in
